AE Techron's **7224** amplifier is a 900 VA, DC-enabled unit that provides exceptional versatility and value. It features a DC to 1 MHz small-signal bandwidth and improved long-term power performance at frequencies above 40 kHz. In continuous operation, a 7224 can provide rated output power for frequencies up to 40 kHz. If more current or power is needed, up to four amplifiers can be combined in series or parallel and operate as a single system.

The 7224 can be configured by the user for high-voltage/low-current, medium voltage and current, or low-voltage/high-current applications. It provides very low noise and very fast slew rates, and can safely drive a wide range of resistive, inductive loads.

The 7224 is typically used to simulate ripple, noise, drop-outs, surges and ground as required by a variety of EMC standards for DC powered electronics like FMC1278, DO-160, and MIL STD 461. It can also be used as a gradient amplifier for very small bore, high-gain MRI and NMR systems.

Features

- Provides rated long-term power at frequencies up to 40 kHz.
